Christy will send us an email. She said that they developed RSLs for both water and sediment, and she is forwarding that to us.

This is the the statement with the previous ATSDR statement

**Subject:** Version 2 - Draft - Confidential - Draft statement for sediment

The sediment samples collected in the Animas River have been analyzed and validated. The interpretation of these results has included a comparison to background to determine if the metal concentrations are consistent with pre-incident levels. Metal results that exceeded pre-incident levels were subsequently compared to risk-based screening levels. These results indicate that minor exceedances of background concentrations were observed for lead, copper and cadmium. However, comparison to risk-based screening values found these exceedances to be within acceptable risk levels. The interpretation of these data was a collaborative effort that included state and local members of the unified command.
